PTW THE DOSIMETRY COMPANY

WORK INSTRUCTION TRAINING · AA JIRA ISSUE MANAGEMENT SYSTEM

Jira Issue Management System (IMS)

How defects and improvements are reported, validated, assessed, approved, implemented and closed in the Jira project “Issue Management”.

PTW-Freiburg GmbH · based on AA Jira Issue Management System rev. 001/06.2026 (roXtra 181298) · about 25 minutes

What the IMS is

The IMS is the validated Jira project in which every defect and improvement of our hardware and software products is recorded and dispositioned. It replaces the Mantis defect management system.

- **Everyone can report.** All employees get reporter-level access in Jira.
- **Two work types.** *Defect* — a problem; *Improvement* — a better property of an existing product.
- **Defined path.** Each issue runs through fixed states; every transition is done by a defined role.
- **Compliant record.** Risk evaluation, traceability and documentation from report to closure, in line with ISO 13485, ISO 14971 and IEC 62304.

> **Post-market issues** (e.g. customer feedback) follow SOP-21.09 Rückmeldungen. Link the triggering Q-Request in the issue.

Where

Jira project **Issue Management (IM)**, board 682 on ptwdosimetry.atlassian.net.

Governing documents

- AA Jira Issue Management System
- AA Software Problem Resolution
- SOP-10.11 Software Development Life Cycle
- SOP-10.12 Change Management

Terms and roles

TERM	MEANING
Issue / Ticket	Jira’s generic word for a work item — here a defect or an improvement.
Defect	Work item that describes a problem.
Improvement	Work item that improves properties of an existing product.
Software problem	Deviation from a requirement or design specification (AA Software Problem Resolution).
RAT / SRAT	Risk Analysis Table / Security Risk Analysis Table.

ROLE	KEY RESPONSIBILITY
Reporter (all)	Creates issues, answers questions, improves the issue if it is sent back.
Project Lead (PL)	Validity Check; starts and closes the work; can reopen.
Product Manager (PM)	Context Assessment; requests Risk Assessment, sends back or rejects.
Quality Manager (QM)	Risk Assessment of defects; approves or sends back. Official title: Risk Manager.

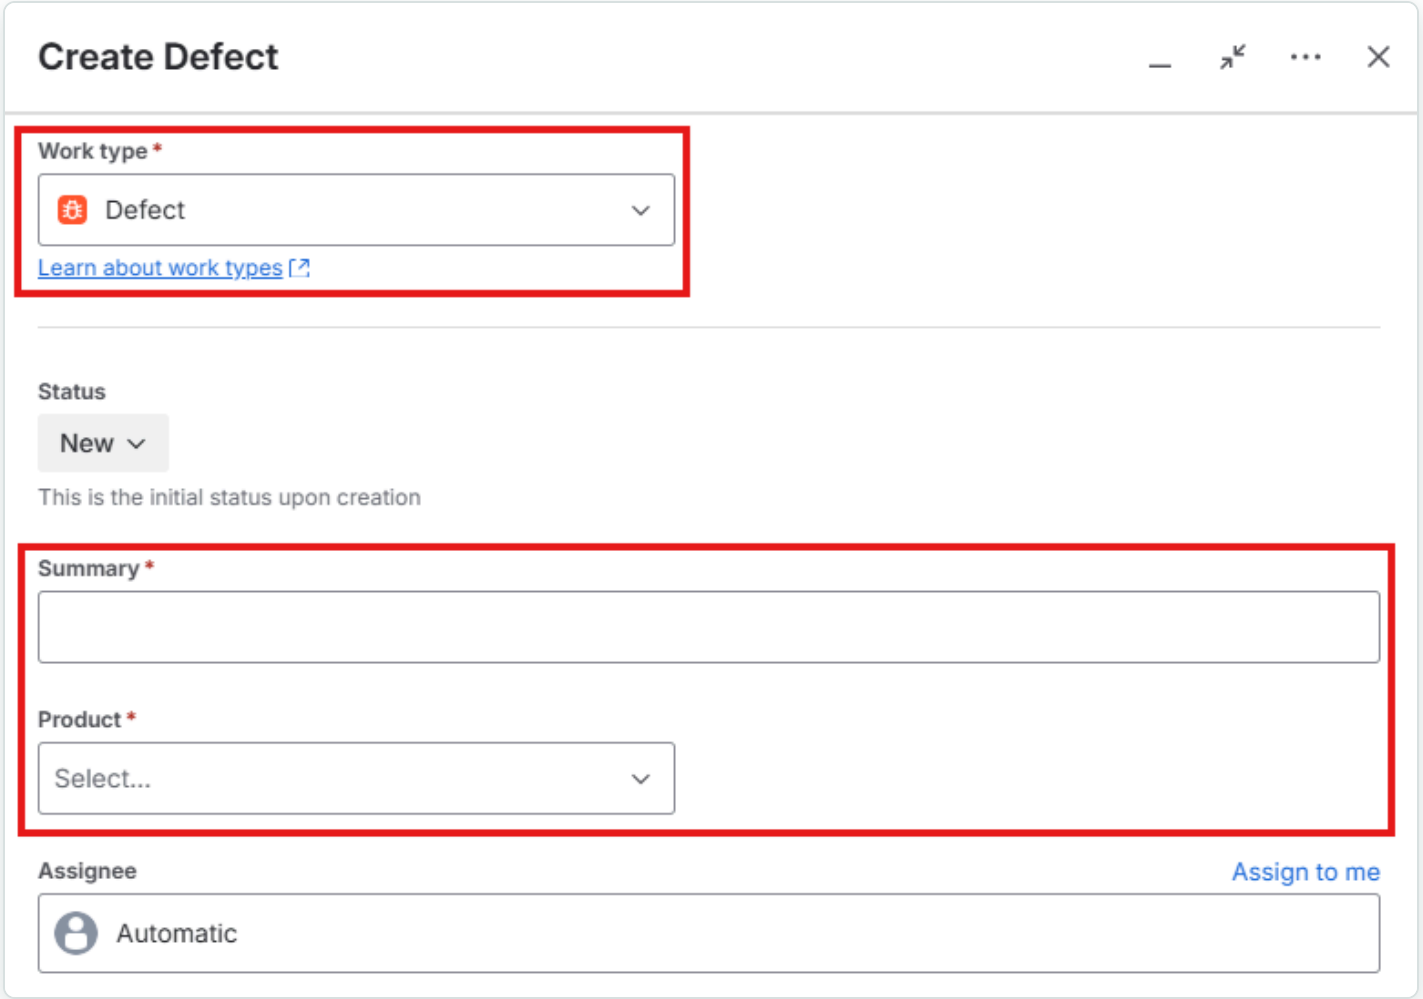

PART 1

Reporting an issue

For everyone: creating a defect or an improvement that can be assessed without follow-up questions.

Creating an issue

1. Open the **Issue Management board** in Jira and click the red **Create** button.
2. Choose the **Work type**: Defect or Improvement.
3. Fill in the mandatory **Summary** (what happens, where) and **Product** (the affected product).
4. Set the **Assignee** to the product's Project Lead. Not known? Assign the **Director Research & Development**.
5. Click **Create** — the issue starts in state `New` and the assignee is notified.

What makes a good issue

The Project Lead checks every new issue against four criteria. Give as much information as possible up front, so it is not sent back to you.

CRITERION	VALID WHEN …
Description	clear and complete
Reproducibility	steps to reproduce are provided
Expected vs. actual	both behaviours are clearly defined
Evidence	screenshots, logs etc. demonstrate the issue

Use the templates

Description, Reproducibility, System Environment and Context Assessment come with a template that tells you what to enter.

Add references

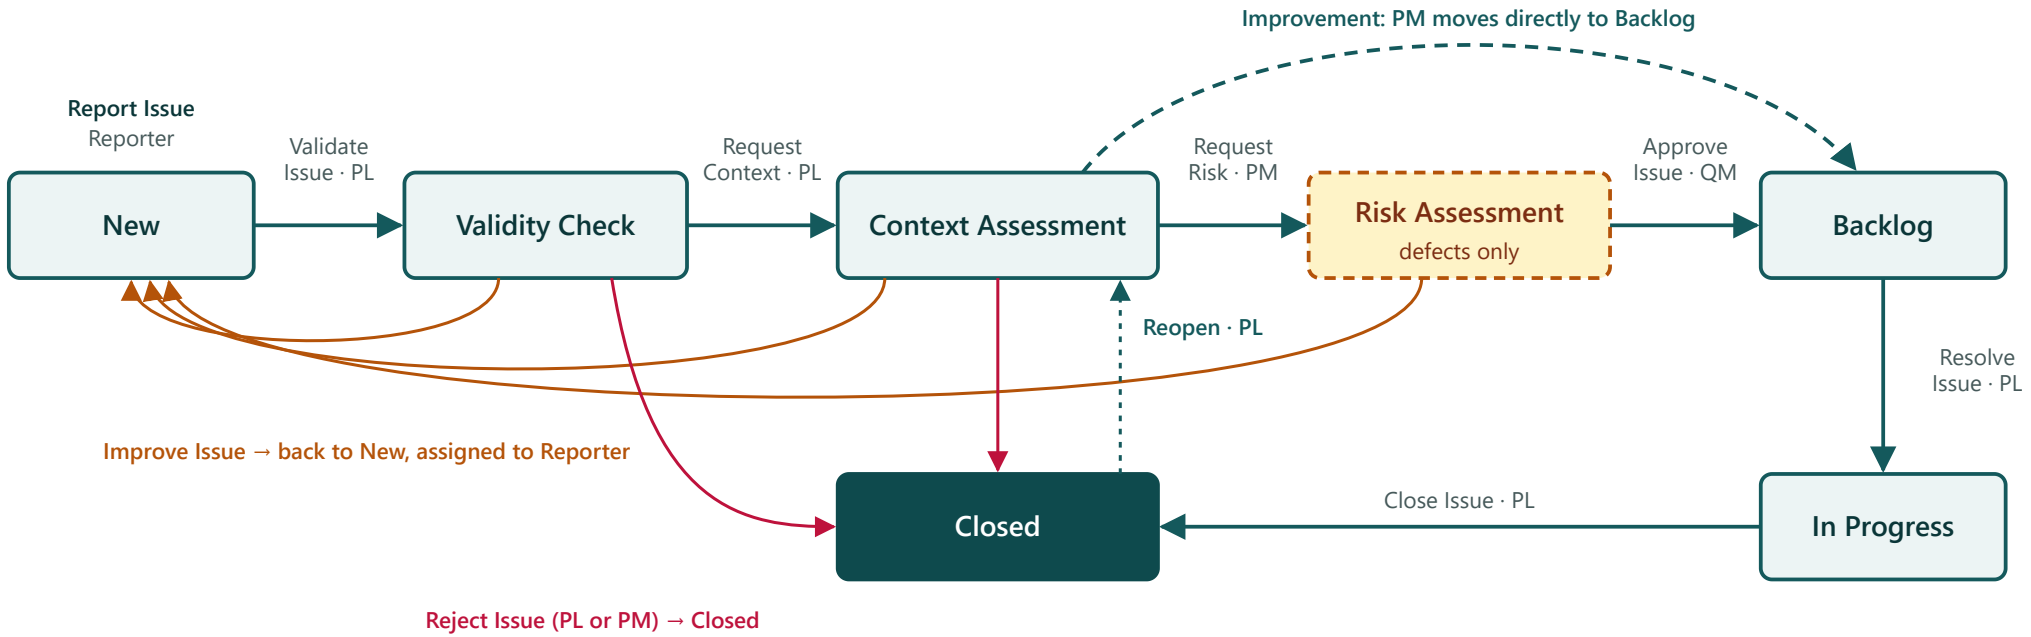

- Q-Request, if the issue comes from feedback
- ID or link from the project's daily tool, if any
- Mantis ID for issues carried over from Mantis

PART 2

The workflow

States, transitions and who moves the issue on.

States and transitions

Who moves the issue — and to whom

FROM	TRANSITION	TO	DONE BY	NEW ASSIGNEE
—	Report Issue	New	Reporter	Project Lead
New	Validate Issue	Validity Check	PL	PL
Validity Check	Request Context Assessment	Context Assessment	PL	Product Manager
Context Assessment	Request Risk Assessment	Risk Assessment	PM	Quality Manager
Risk Assessment	Approve Issue	Backlog	QM	PL
Backlog	Resolve Issue	In Progress	PL	PL
In Progress	Close Issue	Closed	PL	PL
Closed	Reopen Issue	Context Assessment	PL	PL
VC · CA · RA	Improve Issue	New	PL · PM · QM	Reporter
VC · CA	Reject Issue	Closed	PL · PM	—

Transitions, not status. The Status field is read-only — you move an issue by choosing a transition. Apart from reporting, each transition is reserved for the PL, PM or QM role.

Always update the assignee with the transition, so the next responsible person is notified.

Defect or improvement?

Defect

Something does not work as specified or intended.

- Full path incl. **Risk Assessment** by the QM
- Safety and Security Risk Assessment fields are shown
- Severity: Critical · Major · Minor

Improvement

An existing product should get better.

- Same path, but **no Risk Assessment**
- PM moves it from Context Assessment straight to Backlog
- Risk assessment fields are hidden

> Chose the wrong type? During **Validate Issue** the Project Lead can still switch between Defect and Improvement.

Further fields

- Medical Device (Yes/No)
- Change Request · Quality Request
- AE Link (Aligned Elements)
- Mantis ID

PART 3

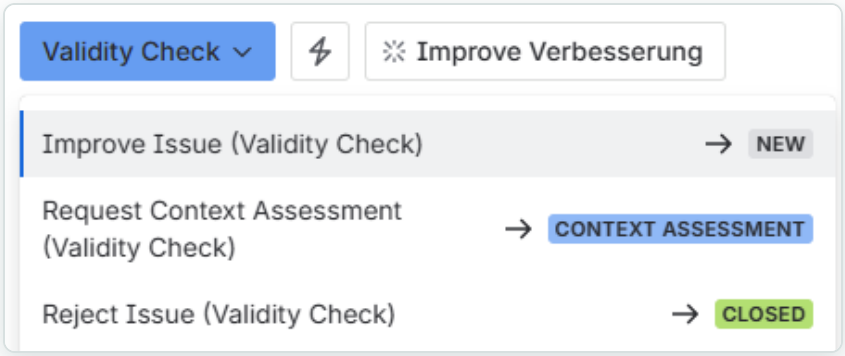

Assessments by role

What the Project Lead, the Product Manager and the Quality Manager check and decide.

Project Lead: Validity Check

When you start on a new issue, first move it to **Validity Check** — so everyone sees it is being looked at. Then check it against the four criteria (description, reproducibility, expected vs. actual, evidence).

OUTCOME	TRANSITION	RESULT
Valid	Request Context Assessment	Context Assessment, assigned to the PM
Not enough information	Improve Issue	New, assigned to the Reporter
Invalid / obsolete	Reject Issue, Resolution “Invalid”	Closed

Selecting the Resolution **Invalid** triggers an automation: the ticket is unassigned and closed.

Product Manager: Context Assessment

The PM decides how the issue fits the product and its use, and records the result in the Context Assessment field.

- **Assess:** impact on a released product, on usability and on operation; affected versions; reproducibility; frequency; affected users or systems; all attached evidence.
- **Record:** all required fields, a summary of the key observations, the **Priority**, and the **Q-Request ID** if a released product is affected.

OUTCOME	NEXT STATE
Defect, assessed	Risk Assessment → QM
Improvement, acceptable	Backlog
Details missing	New → Reporter
Not valid	Closed (Invalid)

Quality Manager: Risk Assessment

Defects only. The QM evaluates the risk with regard to the product characteristics and its intended use.

- **Evaluate:** impact on safety and security; impact on RAT and SRAT; new or additional risks; technical and application-related risks.
- **Required for approval:** overall risk level calculated; acceptance criteria and planned mitigation documented; residual risk clearly stated; all evidence and reference links attached.

OUTCOME	NEXT STATE
Acceptable	Approve Issue → Backlog, assigned back to the PL
Details missing	Improve Issue → New, Reporter

> Sending back? The comment must contain an **actionable, bulleted checklist** of what is missing — tag the PL or PM if needed.

Implementation and closure

Backlog

No open questions — ready for the engineering team.

In Progress

PL moves the issue once engineering starts. Implementation needs a **Change Request** per SOP-10.12 — enter its number in the Change Request field (and the Q-Request number, if any).

Closed

PL closes after confirming: verification complete · all acceptance criteria met · evidence linked.

Reopen

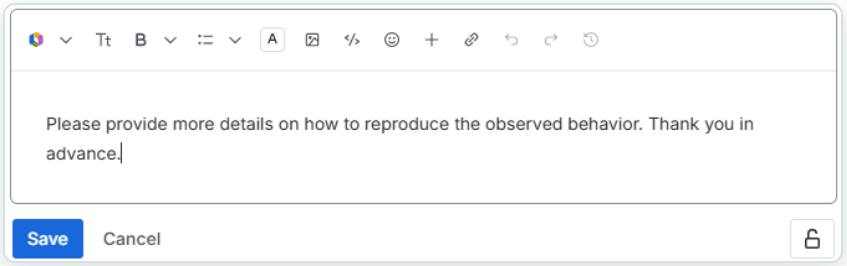

New information about a closed issue? The PL reopens it — it goes back to **Context Assessment**.

Decided not to fix?

Write the rationale into the description or a comment.

Comments, records and traceability

- **Comment every transition.** Explain the decision in the Comments field; mention people with `@name` — they are notified.
- **Keep it in the issue.** All risk-relevant information belongs into the Jira issue: fields, attachments, comments.
- **Link the controlled documents:** FMEA, RAT, SRAT, usability documentation, Q-Request, Change Request.
- **At closure:** link the item in the development tool that documents the fix, the test evidence and the key decisions.

Key points

1. Every employee can and should report defects and improvements in the IMS.
2. Work type, Summary and Product are mandatory; assign the Project Lead (fallback: Director R&D) and add evidence.
3. Path: New → Validity Check (PL) → Context Assessment (PM) → Risk Assessment (QM, defects only) → Backlog → In Progress → Closed.
4. Improve Issue sends it back to the Reporter; Reject Issue closes it as Invalid.
5. No implementation without a Change Request; closure needs verification, met acceptance criteria and linked evidence.
